# Map 1: Locator map

# Map 2: Highlighting Map regions

Unfortunately, in order to draw on my map, I used the locator one of Libya I created and tried to add a "New Shapefile Layer" as polygon. I tried to save it several times. I got always the same warning: "layer creation failed". I open the

messages but there is just "Warning" with not specific feedback txt as an Error in Python. (no feedback on Slack ☹) Screenshot below:

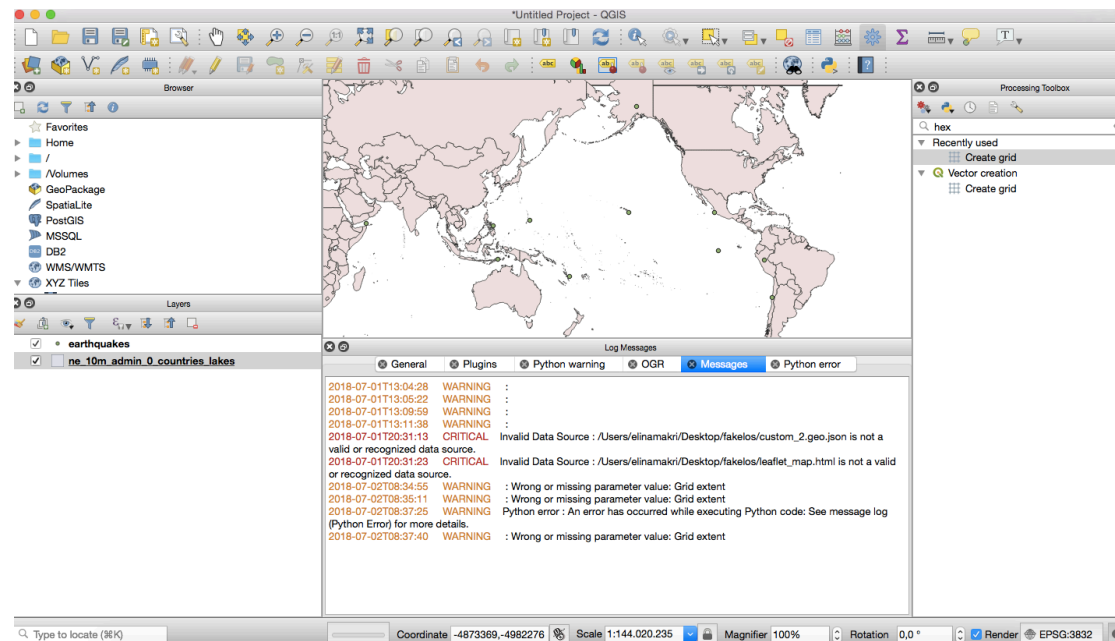

Map 3: Hex bin map

Also for this map, I imported the shape file and the csv I downloaded from the United States Geological Service https://earthquake.usgs.gov/earthquakes/feed/v1.0/csv.php.

I tried to get the Hex with 2 ways from the Menu: Processing => Toolbox => typed "hex" on the box and from the MMQGIS plugin => Create grid
I try to save the file and hit "run" again. QGIS gave me an error.

Moreover, QGIS has blocked twice my computer and I had to restart it…
